

## slime mold

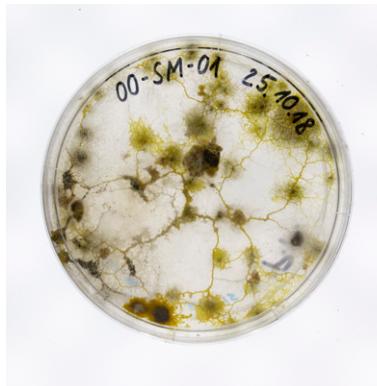

00-SM-01

27.10.18

Contaminated left side:  
thin hairy powderish  
structure

Black spore dots > slime  
mold starts moving forward  
dots and oats

28.10.18

Contaminated left side  
changed to thin dark cores

Oats quite black

Yellow network structure  
around black dots (slime  
mold fighting against  
mold?)

Two orange slime mold  
structures around two oats

30.10.18

Yellow/orange slime mold  
structure moves away from  
mold network

Starts growing on the lid  
of the petri dish (vertical  
growth)

31.10.18

Increase of the yellow  
slime mold structure on the  
lid

01.11.18

Increase of the yellow  
slime mold structure on the  
lid

looks quite healthy

# slime mold

00-SM-01

02.11.18

Yellow network structure  
moved to the left side  
(compressed)

Few thin yellow branches on  
the right side

Light yellow leftovers  
(structure, path)

05.11.18

Yellow network structure  
moved to the right side  
(less compressed)

Two small shriveled dark  
orange slime mold dots on  
the right side

06.11.18

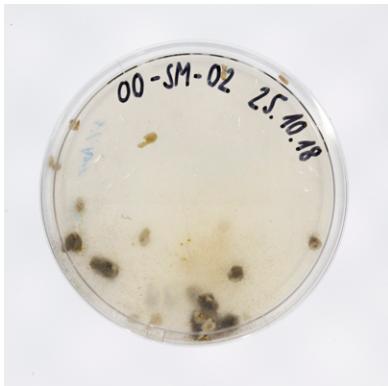

Half of yellow network  
structure moved again to  
the right side (less  
compressed, one branch  
spreads up to many small  
branches)

Two small shriveled dark  
orange slime mold dots on  
the right side

Few dark oats

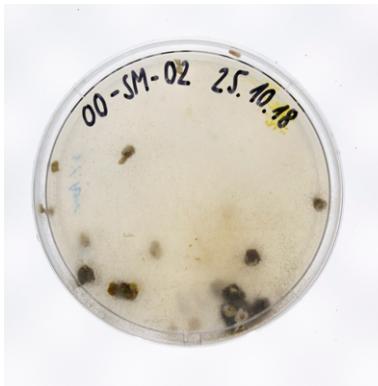

## slime mold

00-SM-02

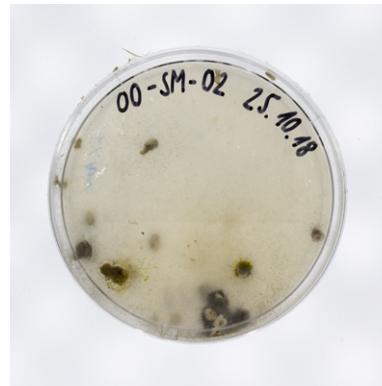

27.10.18

Oats are covered with black  
hairy mold (more in the  
lower area, oats in the  
middle less contaminated)  
  
Less yellow network  
structure or clots

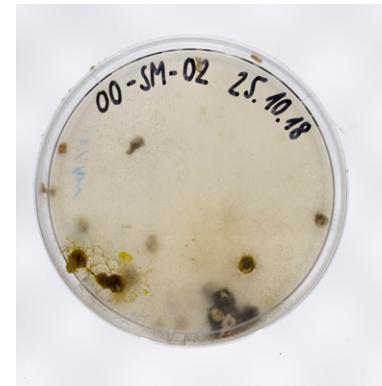

28.10.18

Oats got darker  
  
Slime mold started growing  
on the opposite site of the  
petri dish > needs new oats

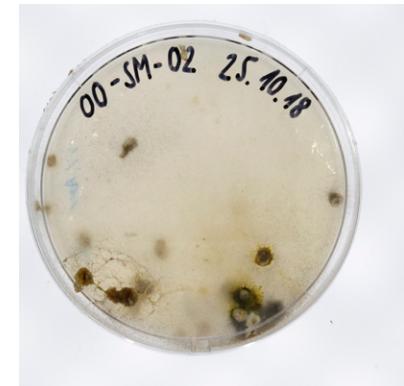

30.10.18

Black oats  
  
Slime mold moved to moldy  
oats

31.10.18

Slime mold moved to close  
moldy oat  
  
Increase of surrounding  
yellow network

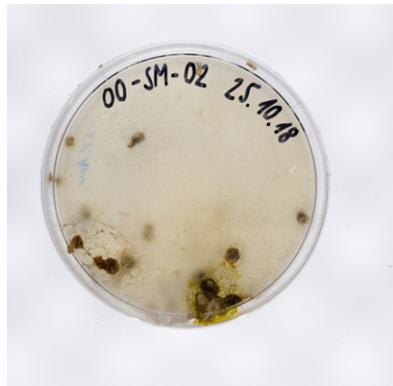

01.11.18

slime mold moved to very  
dark moldy oats  
  
Stronger than mold?  
  
Network lanes leftovers

**slime mold**

00-SM-02

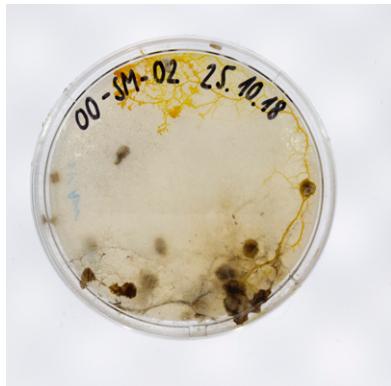

**02.11.18**

increase of yellow network  
structure around moldy oats

Gray mold around oats  
disappear

oats turned black

**05.11.18**

Slime mold moved to the  
opposite side of moldy oats

slime mold passed one oat  
(one branch)

Branche spreads up in many  
small branches

## slime mold

04-SM

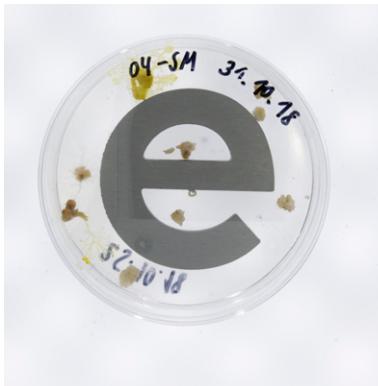

01.11.18

slime mold cores extend in every direction

One thicker core moves to the closest mycelium cores

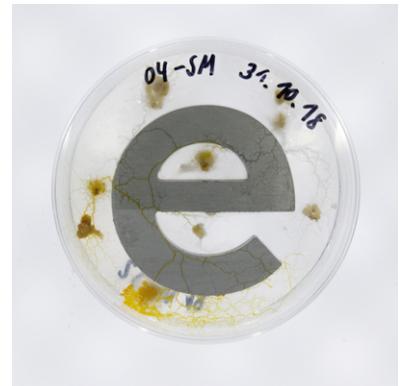

No mold

02.11.18

Slime mold split in two parts

Moves to the closest oats

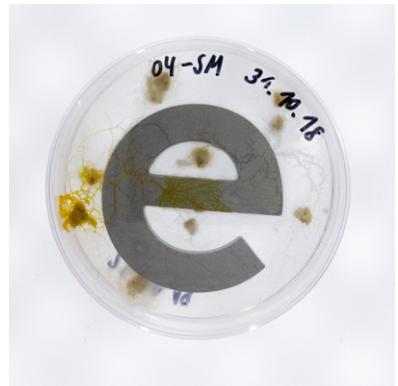

05.11.18

slime mold moved to the opposite side (fresh oat)

Bright mark on the right side and letter

Slime mold branches move on the letter

06.11.18

Slime mold moves from lower oat on the letter

Many small branches on the letter (not afraid of metal?)
